

ABSTRACT OF THE DISCLOSURE

An original sheet reading apparatus includes an original sheet reading station, a main roller, an original sheet feed guide which is located in an original sheet conveyance path in order to guide an original sheet to the reading station, a sub-roller which is located on the downstream side of the reading station in the original sheet conveyance direction and an original sheet discharge guide for guiding the original sheet discharged from the sub-roller toward the discharge side. The discharge guide is located on the downstream side of the reading station in the conveyance direction, in which the front edge of the original sheet contact portion is adapted so as to be positioned at a position being offset with respect to a straight line that links the reading position in the reading station and the original sheet contact position of the sub-roller.
